Less Than 50 µm Micron Diamond Powder refers to ultra-fine diamond particles, either synthetic or natural, that have been carefully milled and graded to particle sizes smaller than 50 micrometers (µm), typically ranging from sub-micron levels up to 50 µm. Known for their extreme hardness, thermal conductivity, and abrasion resistance, these powders are widely used in precision applications such as polishing, lapping, grinding, and fine finishing of hard materials like ceramics, glass, semiconductors, gemstones, and metals. The fine particle size ensures uniform surface treatment, minimal scratching, and controlled material removal, making them essential in industries such as optics, electronics, and advanced manufacturing. Additionally, less than 50 µm micron diamond powder is often incorporated into slurries, pastes, or resin-bonded tools to achieve superior surface finishes and tight tolerances, particularly in processes where nanometer-level smoothness and precision are critical.
