## Abstracts

The global Level 4 Autonomous Driving System market size is predicted to grow from US\$ 650 million in 2025 to US\$ 10551 million in 2032; it is expected to grow at a CAGR of 42.0% from 2026 to 2032.

Level 4 Autonomous Driving Systems refer to fully automated driving systems capable of performing all driving tasks within a defined Operational Design Domain (ODD) without driver intervention. L4 systems can independently complete the entire driving process from origin to destination, including path planning, environmental perception, decision-making, and control. Unlike L2 (Driver Assistance) and L3 (Conditional Automated Driving), L4 allows for complete driver non-involvement, but is typically limited to specific geographical areas or scenarios, such as a specific area of a city, highway, park, or fixed route. Since L4-level products are still in the early stages of commercialization in 2025, most companies are in the R&D phase or in small-batch production, with gross profit margins of approximately 2.41%-6.32%, and small-batch companies achieving approximately 18.4%.

### 1. Opportunities and Driving Factors

**Technological Breakthroughs and Cost Reduction:** With the maturation of sensors, computing platforms, and AI algorithms, the hardware cost of L4 autonomous driving systems is gradually decreasing, and the increased computing power of computing platforms makes more complex driving tasks feasible.

**Transportation and Logistics Demand:** Demand for L4 autonomous driving, especially in driverless trucking and unmanned delivery, is gradually increasing. In the future, it can significantly reduce logistics costs and improve efficiency, becoming a core driver for

businesses to expand.

**Policy Support and Regulatory Development:** Some countries and regions (such as the United States, China, and Europe) have begun to formulate relevant policies and regulations for autonomous driving technology, paving the way for the commercialization of L4 systems. Government support and the development of regulations for autonomous driving will be important market drivers.

## 2. Challenges and Risks

**Technological Immaturity and Safety Issues:** Despite rapid technological progress, L4 autonomous driving systems still face long-term verification and improvement issues, especially in decision-making and control capabilities in complex scenarios. Safety remains a focus for consumers and regulatory agencies, and accidents may affect public trust.

**Regulatory and Compliance Issues:** Because L4 systems do not rely on drivers, the formulation and adaptability of regulations remain major factors restricting their rapid commercialization. The verification standards and liability definitions for Level 4 autonomous driving need to be clear, and the inconsistent standards across countries increase the complexity of global expansion. **Increased competition:** As more and more companies enter this field (including traditional automakers and emerging technology companies), market competition is intensifying, especially as large companies (such as Waymo, Aurora, and Baidu Apollo) have gained a first-mover advantage. Overcoming technological and commercialization barriers will be a challenge for smaller companies.
