The level converter is a voltage conversion device. The level conversion is divided into unidirectional conversion and bidirectional conversion, as well as single power supply and dual power conversion. The dual power conversion adopts a dual-rail solution to meet the performance requirements of various aspects. In the new generation of electronic circuit design, with the introduction of low-voltage logic, the problem of inconsistent input / output logic often occurs within the system, thereby increasing the complexity of the system design. For example, when a digital circuit of 1.8 V communicates with an analog circuit operating at 3.3 V, the two-level conversion problem needs to be solved first, and then a level shifter is required.
