The global LFM/LED Flicker Mitigation market size is predicted to grow from US$ 1420 million in 2025 to US$ 2799 million in 2032; it is expected to grow at a CAGR of 10.4% from 2026 to 2032.

LED Flicker Mitigation (LFM) is an image processing technology designed to address image flicker caused by the high-frequency on-off switching of LED light sources. LEDs are typically driven using pulse-width modulation (PWM), a frequency higher than the human eye can perceive. However, image sensors may detect the LED's off state during short exposure times, resulting in dark areas in the image or falsely misinterpreting it as no signal. This phenomenon is particularly serious in scenarios such as autonomous driving, intelligent transportation, and industrial vision, where it can cause the system to fail to correctly identify traffic lights, vehicle lamps, or electronic signs. LFM technology uses methods such as extending exposure time, adjusting frame synchronization, and optimizing the sensor's dynamic range to enable the image sensor to capture the entire LED light cycle, resulting in high-quality, flicker-free images. Some advanced systems also incorporate algorithms to dynamically adjust exposure parameters to adapt to varying frequencies and ambient light conditions.

United States market for LFM/LED Flicker Mitigation is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.

China market for LFM/LED Flicker Mitigation is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.

Europe market for LFM/LED Flicker Mitigation is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
