The global Light Barium Carbonate market size is projected to grow from US\$ million in 2022 to US\$ million in 2029; it is expected to grow at a CAGR of % from 2023 to 2029.

Light barium carbonate is produced by precipitating barium carbonate from a solution of barium salts. The precipitation process leads to the formation of fine particles with a porous structure, resulting in a lower density product.

In the context of MLCC (Multilayer Ceramic Capacitor) manufacturing, light barium carbonate is commonly used as a key component in the production of the ceramic dielectric layers. The dielectric layers in MLCCs are made of a mixture of ceramic powder and binders. Light barium carbonate is added to this mixture to adjust the properties of the ceramic material.

The use of light barium carbonate in MLCCs offers several advantages. Firstly, its lower density helps to reduce the overall weight of the MLCC, making it suitable for applications where weight is a concern. Secondly, the porous structure of light barium carbonate facilitates the sintering process during MLCC manufacturing, allowing for better control of the shrinkage and porosity of the ceramic layers. This can result in improved electrical performance and reduced defects in the MLCCs.

It's important to note that the specific formulation and application of light barium carbonate in MLCCs can vary between manufacturers and products. The concentration and processing conditions may be adjusted to meet the desired performance and characteristics required for specific MLCC applications.

Light barium carbonate, also known as light precipitated barium carbonate, is a chemical compound with the formula  $BaCO_3$ . It is a variant of barium carbonate that is characterized by its lower density and higher porosity compared to the regular form.
