Abstracts

The global Light Bulb market size is predicted to grow from US\$ million in 2025 to US\$ million in 2031; it is expected to grow at a CAGR of %from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

Over the five years to 2018, the industry has struggled with import penetration and increasing input costs, which has constrained growth. Additionally, the increasing substitution of LEDs for traditional lighting systems has dramatically reduced demand for industry products.

The Lighting and Bulb Manufacturing industry has a low level of capital intensity due to the combined need for automated machinery and human labor. For every dollar spent on wages, \$0.06 is spent on capital assets. Capital investment is largely in manufacturing machinery, which most large operators use to streamline the production process. New manufacturing machinery, equipment and facilities improve the quality of final products while increasing manufacturing efficiency and lowering production costs. Despite being highly automated, the industry still requires a significant amount of labor for the operation of industry machinery. The necessity for human labor drives up wage costs in the industry, lowering the industry's level of capital intensity.
