## Abstracts

The global Light Field Imaging and Display market size is predicted to grow from US\$ 208 million in 2025 to US\$ 298 million in 2032; it is expected to grow at a CAGR of 5.3% from 2026 to 2032.

Light Field Imaging and Display are advanced display systems that reproduce the direction and intensity of light rays from a scene, allowing viewers to perceive three-dimensional images with natural depth cues without necessarily wearing special glasses. Unlike traditional 2D displays or simple stereoscopic 3D displays, Light Field Imaging and Display can present different views from different angles and create a more realistic sense of spatial depth, making them useful for medical imaging, industrial visualization, automotive displays, AR/VR/MR, digital content creation, and immersive exhibitions. Light Field Imaging and Display are generally high-priced products, with consumer or developer-level devices typically ranging from several hundred to several thousand US dollars, while professional, medical, automotive, or large-format systems can range from tens of thousands to over one hundred thousand US dollars depending on size, resolution, optical complexity, and customization level.

The Light Field Display market is still in an early commercialization stage, but it has strong long-term potential as demand grows for more natural, immersive, and glasses-free 3D visualization. Compared with conventional 2D and stereoscopic 3D displays, light field displays can provide richer depth cues and a more realistic spatial viewing experience, making them attractive for medical imaging, industrial design, automotive cockpits, simulation training, exhibitions, and next-generation consumer electronics. However, the market is still constrained by high system cost, complex optical design, content generation requirements, resolution trade-offs, and limited large-scale production capability. In the near term, adoption is likely to be concentrated in

professional and high-value applications, while broader consumer penetration will depend on improvements in display resolution, viewing angle, brightness, content ecosystem, and manufacturing cost.

The upstream supply chain of Light Field Display mainly includes display panels, micro-lens arrays, diffractive optical elements, optical films, spatial light modulators, image processing chips, sensors, backlight modules, precision optical components, display driver ICs, and 3D content rendering software. Key upstream capabilities are concentrated in optical design, nano/micro-structure manufacturing, high-resolution panel integration, light field rendering algorithms, multi-view image processing, and optical calibration. Downstream applications mainly include professional 3D visualization, medical imaging, industrial design, automotive displays, AR/VR/MR devices, advertising and exhibition displays, education, entertainment, and digital content creation. Demand is currently more concentrated in high-value professional and commercial scenarios, while broader consumer adoption still depends on lower hardware cost, better content ecosystem, higher resolution, wider viewing angle, and improved mass production capability.
