Light well intervention refers to a series of relatively low-intensity, less invasive operational activities and techniques carried out in oil wells. These operations are designed to address various issues and perform maintenance tasks without the need for large-scale, heavy equipment and complex procedures typically associated with major well interventions. Light well intervention techniques often involve the use of specialized small-scale tools and equipment, such as coiled tubing units, wireline tools, and downhole robots. They can be used for tasks like wellbore cleaning, scale removal, sand control, downhole equipment inspection and repair, and reservoir monitoring. These operations are usually more cost-effective and have a shorter operation time compared to traditional heavy well interventions, while still being able to achieve many of the necessary objectives to ensure the efficient operation and prolong the lifespan of the oil well.
