The global Light Weight Deflectometer market size is predicted to grow from US\$ million in 2025 to US\$ million in 2031; it is expected to grow at a CAGR of %from 2025 to 2031.

A Light Weight Deflectometer (LWD) is a portable and non-destructive testing device used in the field of civil engineering and construction to assess the compaction quality and bearing capacity of soils, subgrades, and base courses. It measures the deflection, or deformation, of the ground surface when subjected to a dynamic load applied by the LWD device. This information helps engineers and construction professionals ensure that roadways, pavements, and other structures are built on a stable and compacted foundation.

LWDs have seen improvements in sensor accuracy and sensitivity. This allows for more precise measurements of deflection, enabling engineers to make finer assessments of soil and material properties.
