The global Limulus Tripeptide market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

The horseshoe crab reagent tripeptide is a biochemical reagent used to detect bacterial endotoxins. It is composed of tripeptide compounds extracted from horseshoe crab blood. It is highly sensitive and can quickly detect trace amounts of endotoxins in samples. It is widely used in biopharmaceuticals, medical devices, food safety and environmental monitoring to ensure product safety and quality.

As an important tool for detecting bacterial endotoxins, horseshoe crab tripeptide has extremely high sensitivity and reliability, and plays a key role in ensuring the safety of drugs, medical devices and food. However, with the development of science and technology and the need to protect horseshoe crab resources, how to develop alternative synthetic reagents while maintaining detection accuracy has become the focus of industry attention. The development direction of horseshoe crab tripeptide may need to find a balance between traditional biological products and emerging synthetic technologies to meet the challenges of wider application needs and environmental protection in the future.
