Abstracts

The global Linalyl Formate market size is predicted to grow from US$ 29.35 million in 2025 to US$ 39.07 million in 2032; it is expected to grow at a CAGR of 4.3% from 2026 to 2032.

In 2024, global Linalyl formate production reached approximately 220 tons, with an average global market price of around US$ 127 per kilogram. Linalyl formate is an ester formed from linalool and formic acid, belonging to the family of naturally occurring fragrance compounds. It is typically found in essential oils such as bergamot, lavender, and petitgrain, where it contributes to their sweet, fruity, and floral aroma profile with fresh green undertones. In industry, linalyl formate is valued as a key ingredient in perfumes, cosmetics, and flavorings, where it imparts delicate, natural notes and enhances blends. Its pleasant scent, along with its relatively low toxicity and biodegradability, makes it widely used in fine fragrance formulations, personal care products, and occasionally in food flavoring at safe concentrations.

The market for linalyl formate is primarily driven by the rising demand in the fragrance and flavor industries, where consumer preference for natural, plant-derived ingredients is fueling its use in perfumes, cosmetics, and personal care products. Growing interest in clean-label and sustainable formulations is pushing manufacturers to incorporate naturally sourced esters like linalyl formate into their product lines. The expansion of aromatherapy, wellness, and spa sectors also contributes to demand, as essential oils containing linalyl formate are valued for their fresh, floral, and soothing scent profiles. Additionally, the global growth of premium cosmetics and fine fragrances, especially in emerging markets, further accelerates the adoption of linalyl formate as a key aromatic compound.
