Lincomycin antibiotics belong to a class of antibiotics derived from the bacterium *Streptomyces lincolnensis*. These antibiotics inhibit bacterial protein synthesis by binding to the 50S ribosomal subunit of the bacterial ribosome, thus preventing the addition of amino acids to the growing peptide chain. Lincomycin antibiotics are primarily used to treat infections caused by Gram-positive bacteria, including *Streptococcus* and *Staphylococcus* species. They are particularly effective against anaerobic bacteria and are often used in the treatment of infections such as acne, respiratory tract infections, and pelvic inflammatory disease. However, their use is limited due to the risk of developing antibiotic resistance and potential adverse effects such as gastrointestinal disturbances and allergic reactions.

The global Lincomycin Antibiotics market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
