## Abstracts

The global Linear Drive Linear Motor market size is predicted to grow from US\$ 8825 million in 2025 to US\$ 14870 million in 2032; it is expected to grow at a CAGR of 7.9% from 2026 to 2032.

A linear drive linear motor is a drive solution that differs from a rotary motor: Unlike a rotary machine, a linear motor does not generate rotating movement for the driven object. Instead, it moves the object in a straight line or along a curved track. A linear motor is used when the dynamics that a rotating servomotor achieves are insufficient and a direct linear movement has to be implemented instead.

Expanding robotics segment and micro-trends across industries are majorly driving the growth of the market. This tiny or micro trend is quickly gaining traction across industries. Advances in automation and artificial intelligence (AI) are driving innovation in robotics, spurring the development of tiny direct drive motors. With the advent of smaller, smarter robot designs, tiny direct-drive motors enable robotics to expand into new industries. Disruptive technologies create opportunities for miniature direct drive motors to solve unique challenges in the surgical, warehouse, collaborative robotics and service robotics industries.
