The global Linear Fresnel Lens market size is predicted to grow from US$ 58.56 million in 2025 to US$ 102 million in 2032; it is expected to grow at a CAGR of 8.4% from 2026 to 2032.

In 2024, global production of linear Fresnel lenses reached 4.32 million units, with an average selling price of around US$13 per lens. A linear Fresnel lens is a thin, sheet-like optical element designed based on the Fresnel principle. Its optical surface consists of a series of concentric, serrated grooves. These grooves are "stretched" into parallel linear channels, allowing incident light to converge onto a focal line rather than a single focal point. It is significantly thinner, lighter, and uses less material, and is primarily used in solar power generation, lighting, projection, laser alignment and machine vision, and vision correction. Upstream suppliers mainly include raw material suppliers such as optical glass/plastics and precision machining equipment manufacturers. Downstream applications include solar concentrator module manufacturers, lighting and machine vision manufacturers, and equipment manufacturers integrating custom optical compone
