A linear potentiometer is a type of position sensor. They are used to measure displacement along a single axis, either up and down or left and right. Linear potentiometers are often rod actuated and connected to an internal slider or wiper carrier.

Linear Motion Potentiometers are precision devices that are widely used in various industries for measuring linear displacement or position. These potentiometers provide accurate and repeatable measurements, making them ideal for applications requiring precise positioning and control. They consist of a resistive element and a wiper that slides along the element, changing the resistance and generating an electrical signal proportional to the position.
