The global Linear Photoconductive Detector Single Element market size is predicted to grow from US$ million in 2025 to US$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Semiconductor infrared detectors can be divided into three generations since their appearance: the first generation is the linear photoconductive detector array. The linear array detector technology was first used for PbS, PbSe and InSb detectors and has been widely used. The photoconductive detector unit is a detector made based on the photoconductive effect. It uses the property that the conductivity of semiconductor materials changes under light to convert the received light signal into an electrical signal output. This detector has the characteristics of fast time response, large output current, small size, light weight, etc., and shows high sensitivity to various radiations such as X-rays, visible light and charged particles.

The market is constantly changing, and the following points are worth noting:

The market concentration is high.

The EU RoHS3 directive points out the restriction of the use of certain hazardous substances in electrical and electronic equipment. It regulates the use and introduction of hazardous substances in electrical and electronic components. RoHS stands for the Restriction of Hazardous Substances Directive, which refers to the restriction of the use of hazardous substances such as lead, mercury, cadmium, hexavalent chromium, polybrominated biphenyls (PBB) and polybrominated diphenyl ethers (PBDE).

With the introduction of the RoHS EU Restriction of Hazardous Substances Directive,

infrared detectors based on mercury cadmium telluride (HaCdTe), lead selenide (PbS) and lead sulfide (PbSe) will be banned from industrial applications after July 2024, which will further stimulate the transition to infrared detectors based on I-V semiconductors.
