Linear polarized 3D glasses are a type of 3D glasses that use linear polarization to create the illusion of three-dimensional images on a screen. These glasses have lenses that are polarized in a specific direction, either vertically or horizontally. When used with a compatible 3D display, such as a 3D TV or movie theater screen, the glasses filter out the light waves that are not aligned with their polarization direction, allowing each eye to see a slightly different image. This creates the perception of depth and dimension in the images being viewed. Linear polarized 3D glasses are commonly used in movie theaters and for home entertainment systems that support passive 3D technology.

The global Linear Polarized 3D Glasses market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
