The global Linear Thin Film Polarizers market size is predicted to grow from US\$ 385 million in 2025 to US\$ 1735 million in 2032; it is expected to grow at a CAGR of 24.5% from 2026 to 2032.

Linear thin film polarizer is an optical element composed of multi-layer thin films. Its core lies in screening light with a specific polarization direction through the periodic diffraction structure of the multi-layer thin film. This element is usually prepared by physical vapor deposition or magnetron sputtering technology. When linear polarized light passes through, only light with the same polarization direction can pass through, and light in other directions is filtered out.

At present, there is fierce competition in the linear thin film polarizer market. Many domestic and foreign companies are actively developing and producing linear thin film polarizers to seize market share. At the same time, with the continuous advancement of technology and the reduction of costs, the application scope of linear thin film polarizers is also expanding.
