The global Linear Voice Coil Motors (VCM) market size is predicted to grow from US\$ 2779 million in 2025 to US\$ 3984 million in 2032; it is expected to grow at a CAGR of 5.4% from 2026 to 2032.

Linear Voice Coil Motors (VCMs) are a type of electromechanical device used to create linear motion, typically in applications requiring precise and rapid movements. They operate on the same principles as traditional voice coil motors, but instead of producing rotary motion, they generate linear motion.

Electromagnetic Principles: A Linear VCM uses the interaction between an electric current and a magnetic field to produce motion. It consists of a coil of wire (the voice coil) placed within a magnetic field generated by permanent magnets.

Current Flow: When an electric current flows through the coil, it creates a force due to the interaction with the magnetic field (as described by Fleming's Left-Hand Rule). This force is directed along the axis of the coil, causing it to move linearly.

Motion: The direction and magnitude of the linear motion depend on the direction and strength of the current supplied to the coil. By controlling the current, you can precisely control the position, velocity, and force of the linear motion.

United States market for Linear Voice Coil Motors (VCM) is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
