The global Liquefied Gas Pressure Reducing Valve market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Liquefied Gas Pressure Reducing Valve is a device designed to regulate and control the pressure of liquefied gases, such as propane, butane, or LPG (liquefied petroleum gas), as they are released from a high-pressure storage container. These valves ensure that the gas exits at a safe and usable pressure for appliances or industrial systems. By reducing the pressure from storage levels, which can be hazardous, to a lower, stable output pressure, they play a critical role in maintaining safety and efficiency in gas systems. The valve typically operates by using a diaphragm or spring mechanism that adjusts according to changes in pressure. These valves are widely used in residential, commercial, and industrial settings, including heating systems, gas-powered appliances, and fuel supply systems.
