Liquid-based sound damping coating is a type of coating specifically designed to reduce or dampen sound transmission through various surfaces. It is applied as a liquid and forms a thin layer when it dries. The primary purpose of liquid-based sound damping coatings is to minimize the transmission of airborne sound waves, vibrations, and noise. The coating typically contains special additives, such as viscoelastic polymers or fillers,

which help absorb sound energy and convert it into heat. This helps to reduce the amplitude and intensity of sound waves, thus reducing noise levels.
