Liquid e-fuels, or liquid electrofuels, are synthetic fuels produced using electricity derived from renewable sources such as solar, wind, or hydroelectric power. The process typically involves capturing carbon dioxide (CO₂) from the atmosphere or other sources and combining it with hydrogen produced through the electrolysis of water. This combination, using renewable energy and CO₂, results in the creation of carbon-neutral fuels that can be used in existing combustion engines and infrastructure. These fuels are particularly appealing as they offer a pathway to decarbonize sectors that are difficult to electrify, such as aviation and shipping.

The global Liquid E-fuels market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
