The global Liquid Flow Screed market size is predicted to grow from US$ 2055 million in 2025 to US$ 2988 million in 2031; it is expected to grow at a CAGR of 6.4% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

Liquid flow screed is self-levelling. No vibration is necessary to remove bubbles and densify the liquid mass. Due to the easy consolidation thickness can sometimes be reduced in comparison to conventional screeds. This minimises heat storage leading to a floor that reacts quickly to user requirement hence raising the efficacy of underfloor heating.

A liquid floor screed will have a more even surface than a hand laid semi-dry traditional screed and because it is denser sound is deadened and heat transfer speeded up. Better heat transfer (aka increased thermal conductivity) can be advantageous when underfloor heating is in place. Anhydrite screeds are even more thermally conductive than their cement equivalents.
