The global Liquid Helium Generator market size is predicted to grow from US\$ million in 2025 to US\$ million in 2031; it is expected to grow at a CAGR of %from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

The liquid helium generator is a device that converts liquid helium into helium gas. Liquid helium is produced at a low temperature of 4.2k. Therefore, its low temperature conditions are suitable for the research needs of superconductors, low temperature physics and material properties.

The process of helium liquefaction is to compress the helium gas and enter the liquefaction machine through the impurity adsorber. It is first pre-cooled by liquid nitrogen, and then compressed by five heat exchangers and two expansion engines. The temperature is gradually reduced to a temperature of 6k to 18k through the JT valve. It is converted into liquid helium, and this cooling process takes 3 to 4 hours to reach the working temperature.
