The global Liquid Lens Telecentric Lenses market size is predicted to grow from US\$ 19.95 million in 2025 to US\$ 29.61 million in 2032; it is expected to grow at a CAGR of 5.9% from 2026 to 2032.

The liquid telecentric lens is an optical component that integrates liquid lens technology with the principles of telecentric optics. It not only possesses the characteristics of telecentric lenses, such as high resolution, low distortion, large depth of field, and parallel light design, enabling it to maintain a constant image magnification within a certain object distance range, but also incorporates the advantage of liquid lenses, which allow for rapid electronic adjustment of focal length. By leveraging the fluidity and adjustability of liquid optical media, it achieves specific optical performances. Consequently, the liquid telecentric lens can effectively eliminate parallax and measurement errors, achieve rapid autofocus within milliseconds, and adapt to imaging objects at different working distances. It overcomes the limitation of fixed working distances in traditional telecentric lenses, significantly enhancing detection efficiency and flexibility. Primarily used in high-precision optical measurement and imaging systems, it is an ideal choice for applications such as calibration, measurement, and layout.
