The global Liquid Loading Arm market size is predicted to grow from US$ 725 million in 2025 to US$ 936 million in 2031; it is expected to grow at a CAGR of 4.4% from 2025 to 2031.

Liquid loading arms are mainly used for loading and unloading of liquid media in automobile tank trucks, train tank trucks or tank ships. It is divided into two categories: land use and ship use. Among them, land-based liquid loading arms are commonly known as 'crane pipes', including automobile loading arms and train loading arms, which are mainly used for loading of land tank trucks; while ship-based liquid loading arms are installed on the dock to complete the loading of liquid petrochemical products. This type of equipment has the ability to adapt to different tides, freeboards and hull movements. In addition, liquid loading arms can also be divided into three categories according to the type of loading and unloading goods: liquid chemicals, liquefied gas and oil products. It is mainly composed of swivel joints, arm bodies (including inner arms and outer arms), vertical pipes (or three-dimensional joints, mainly selected according to land or ship use), balancers, control systems and other components. Among them, the swivel joint is responsible for connecting the conveying pipeline and the loading arm so that the liquid can flow smoothly; the arm body is responsible for adjusting the flow direction and angle of the liquid to meet different loading needs.

Liquid loading arms have many advantages. Its swivel joint can achieve multi-angle rotation and flexibly adapt to different loading and unloading needs; it adopts high-quality sealing materials and designs to ensure that fluid materials will not leak during the transmission process; it can adapt to relatively harsh operating environments such as high temperature, low temperature, and corrosive media; and it is equipped with anti-static devices, locking devices and other safety facilities to ensure the safety of operation. Therefore, liquid loading arms are widely used in many industries such as petroleum, chemical, and food, and are used for loading and unloading liquid chemical

media such as gasoline, diesel, methanol, liquid ammonia, liquefied gas, and acids and alkalis. In order to ensure the normal operation of the liquid loading arm and extend its service life, regular maintenance is required, such as checking whether each system is normal, whether the fasteners are loose, and replacing swivel joints and sealing rings. In the future, with the advancement of technology and the development of industry, liquid loading arms are expected to develop in a more intelligent and automated direction.
