The global Liquid Scale Dissolver market size is predicted to grow from US\$ 2136 million in 2025 to US\$ 3230 million in 2032; it is expected to grow at a CAGR of 6.1% from 2026 to 2032.

Liquid Scale Dissolver is a chemical solution or formulated fluid designed to dissolve mineral scale deposits (such as calcium carbonate, magnesium hydroxide, barium sulfate, silica scale, and metal oxides) that accumulate inside industrial pipelines, heat exchangers, boilers, cooling towers, desalination membranes, oil & gas production tubing, and geothermal systems. These dissolvers typically contain inorganic acids (e.g., hydrochloric or sulfamic acid), organic acids (e.g., citric or formic acid), chelating agents (EDTA, DTPA), corrosion inhibitors, surfactants, and dispersants to selectively break down scale while protecting base metals. The supply chain begins upstream with bulk chemical producers supplying acids, chelants, and inhibitor intermediates; midstream specialty chemical formulators blend, stabilize, and package the dissolver formulations (often customized by scale type and metallurgy); downstream distribution flows through industrial chemical suppliers, oilfield service companies, water treatment service providers, and facility maintenance contractors; end users include power generation plants, oil & gas operators, chemical processing facilities, mining operations, food & beverage plants, HVAC maintenance firms, and municipal water utilities. In 2025, global Liquid Scale Dissolver production reached about 4.6 million tons, supported by roughly 6 million tons per year of installed capacity, with average prices ranging from USD 420–750 per ton and industry gross margins around 22%.
