A Liquid Silicone-Based Gap Filler is a thermally conductive material designed to fill gaps between electronic components and heat sinks or other cooling systems to enhance heat dissipation. This type of gap filler is composed of silicone infused with thermally conductive particles, offering both flexibility and high thermal conductivity. When applied, the liquid form allows it to conform perfectly to irregular surfaces and fill any voids, ensuring efficient thermal transfer by minimizing air pockets, which are poor conductors of heat. Once cured, it forms a resilient, elastomeric layer that maintains its thermal and mechanical properties over a wide range of temperatures. Liquid silicone-based gap fillers are widely used in electronics, automotive, and telecommunications industries where efficient heat management is crucial for the performance and reliability of high-power devices. Their ability to provide a durable thermal interface while also offering electrical insulation and vibration dampening makes them an essential component in the design of modern electronic systems.

The global Liquid Silicone Based Gap Filler market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
