Lithium Argyrodite Sulfide Electrolytes are a class of solid-state lithium-ion conductors with the general formula  $\text{Li}_x\text{PS}_4\text{X}$ , where X is typically a halide such as Cl, Br, or I. These materials adopt the argyrodite crystal structure and are renowned for their high lithium-ion conductivity (up to  $\sim 10^{-2}$  S/cm), low activation energy, and mechanical softness, which allows easy pressing into solid electrolyte layers without sintering. Primarily used in all-solid-state lithium batteries (ASSLBs), they offer good electrochemical performance and are compatible with various cathodes and lithium metal anodes, especially when surface modifications are applied. Despite their advantages, they are sensitive to moisture and air, releasing toxic hydrogen sulfide gas upon exposure, necessitating careful handling in inert environments.

United States market for Lithium Argyrodite Sulfide Electrolytes is estimated to increase from US\$ million in 2024 to US\$ million by 2031, at a CAGR of % from 2025 through 2031.
