Abstracts

The global Lithium Battery Safety Compulsory Certification market size is predicted to grow from US\$ 859 million in 2025 to US\$ 1477 million in 2032; it is expected to grow at a CAGR of 8.6% from 2026 to 2032.

Lithium Battery Safety Compulsory Certification is a 'safety entry threshold' established by the government through legislation. It requires products to pass testing by designated institutions and affix certification marks (such as China's CCC certification and the EU's CE certification) before they can be circulated. The core purpose is to prevent safety risks such as thermal runaway and overcharging, ensuring personal and property safety. The industry's gross profit margin can reach 20%-40%.

Market drivers primarily include the following:

Forced Policy and Standard Upgrades

China's inclusion of lithium-ion batteries in its CCC mandatory certification management forces companies to improve product safety and compliance. The EU's Battery Regulation requires a 70% battery recycling rate by 2030, driving the industry towards green transformation. Simultaneously, the improvement of international standards (such as IEC 62660) accelerates technological standardization, forming a competitive barrier of 'core patents + large-scale production.'

Expanded Application Scenarios and Upgraded Demands

Increased penetration of new energy vehicles, large-scale deployment of energy

storage systems, and accelerated iteration of consumer electronics place higher demands on battery energy density, charging speed, and safety. For example, lithium batteries for electric bicycles need to operate in a wide temperature range of -20° to 60°, and drones need to support charging rates of 6C or higher, driving technological iteration towards higher power and longer lifespan.

Technological Iteration and Ecosystem Improvement

Innovative technologies such as solid-state batteries and sodium-ion batteries reduce dependence on scarce resources and enhance cost competitiveness. The Hydrogen as a Service (HaaS) model lowers the barrier to entry for end users by integrating fuel cell systems, hydrogen supply, and maintenance services. In addition, cross-industry collaborations (such as alliances between energy companies and automakers) accelerate the implementation of technologies, forming a virtuous cycle of 'technology iteration + ecosystem synergy'.
