Lithium battery tabs are key components that connect the battery cells to the external circuits, and are usually made of copper (negative electrode) or aluminum (positive electrode) materials. Tabs are used to lead the positive and negative electrodes of the battery cells out of the battery casing through welding or other connection methods, forming the positive and negative terminals of the battery, which facilitates external circuit connection and energy transmission. The design and manufacture of tabs are crucial to the performance and safety of lithium batteries because they directly affect the internal resistance, conductivity and heat dissipation of the battery.

The global Lithium Battery Tabs market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
