The global Lithium Battery Vacuum Dehydration and Baking Line market size is predicted to grow from US$ 1972 million in 2025 to US$ 4526 million in 2032; it is expected to grow at a CAGR of 12.6% from 2026 to 2032.

A lithium battery vacuum dehydration and baking line is an automated production system used in lithium-ion battery manufacturing to remove trace moisture from electrodes, cell components, or assembled cells under vacuum and controlled heating conditions, ensuring ultra-low moisture levels (typically ppm level) to prevent electrolyte degradation and performance failure. In 2025, global Lithium Battery Vacuum Dehydration and Baking Line production reached approximately 588 Units. The lithium battery vacuum dehydration and baking line is a critical process equipment segment in the midstream of the lithium-ion battery manufacturing equipment industry chain. It belongs to the front-end drying and moisture-sensitive process control stage, designed to remove trace water content from electrodes, cell casings, and components under vacuum and controlled heating conditions before electrolyte filling. This ensures safety performance and cycle life, especially for high-energy-density battery chemistries. The upstream segment consists of vacuum system suppliers, heating element manufacturers, control system providers, and structural component vendors. Among them, vacuum pumps (such as dry pumps and Roots pumps) and temperature control systems are the most critical components determining equipment performance.

The lithium battery vacuum dehydration and baking line is a critical process equipment used in lithium-ion battery manufacturing for drying electrodes, cell components, and semi-finished cells. It belongs to the upstream core process equipment segment in the lithium battery production equipment industry chain. By combining vacuum conditions with precise thermal control, the system reduces moisture content in battery materials to

ppm levels, ensuring electrolyte stability and long-term cycling performance.
