The global Lithium Bromide Absorption Heat Pump Device market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Lithium Bromide Absorption Heat Pump Device is a heat pump equipment that uses lithium bromide to absorb water vapor to complete cooling or heating. Unlike traditional mechanical compression heat pump equipment that requires electricity to drive the compressor, it uses low-grade thermal energy (such as waste heat, solar energy, etc.) to drive the absorbent circulation process, thereby achieving energy saving and environmental protection effects.

Lithium Bromide Absorption Heat Pump Equipment consists of four main components: evaporator, absorber, generator and condenser. When a low-temperature heat source (such as condensed water, geothermal energy, solar energy, etc.) passes through the evaporator, it causes the absorbent (such as lithium bromide) in it to absorb water molecules to form an absorption liquid. The absorbing liquid enters the generator after passing through the absorber, and is heated by high-temperature heat sources (such as natural gas, steam, electric energy, etc.). Water molecules are released from the absorbent to form water vapor. The water vapor is cooled through the condenser and turned into liquid water, and then returned to the evaporator for recycling.

United States market for Lithium Bromide Absorption Heat Pump Device is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
