The global Lithium Foil market size is predicted to grow from US\$ 1992 million in 2025 to US\$ 3290 million in 2032; it is expected to grow at a CAGR of 7.6% from 2026 to 2032.

Global lithium foil sales reached 56,343 tons in 2025, with an average price of US\$36,142 per ton.

Lithium is extremely soft and the lightest metal out of the 103 metallic elements (specific gravity 0.5). Silver-white in color, lithium reacts strongly with water and even at room temperature turns black when exposed to nitrogen. The foil is wrapped into a coil and packed in an inert gas state when shipped.

The raw material for lithium foil is high-purity metallic lithium. Industrially, it typically starts with battery-grade lithium ingots with a purity of 99.9%. Impurities such as sodium, potassium, calcium, and iron are first reduced to 15ppm through vacuum distillation or zone melting, and then cold-rolled to 200µm under argon protection. Lithium ingot costs account for 65-70% of the total foil cost, and the low yield of rolled products (60-70%) is another major cost item.

Cost Structure: High-purity lithium ingots 65-70%, electricity and argon protection 10%, roll wear and equipment depreciation 8%, labor and quality inspection 7%, packaging, transportation, and gross profit 5-10%. The current processing fee for 20µm ultra-thin foil is approximately 40-50 RMB/kg; the processing fee increases exponentially with thinner thickness and wider width.
