Lithium battery slot die is a crucial component in the production process of lithium-ion batteries. Its main function is to evenly and accurately coat the positive and negative electrode material slurries on the current collector (such as aluminum foil or copper foil) to form an electrode sheet. The Slot Die usually contains a precision-designed slit inside. When the slurry containing active substances passes through the die, the coating thickness is adjusted by controlling the opening size of the slit and the distance from the substrate. Slot Die performs continuous or intermittent coating operations on the current collector as the coating machine moves.

The global Lithium Ion Battery Slot Die market size is projected to grow from US\$ 369 million in 2024 to US\$ 945 million in 2030; it is expected to grow at a CAGR of 17.0% from 2024 to 2030.
