Lithium lactate crystals are organic lithium salts formed by lactic acid ($C_3H_5O_3$) and lithium ions (Li^+), and often exist in a crystalline state. It is a white or off-white solid with good water solubility and biocompatibility, and has certain applications in the fields of chemistry, medicine and electrochemistry. For example, it can be used as a lithium supplement in pharmaceutical preparations, used in lithium ion conduction systems in functional materials, and is also studied as a precursor material for lithium-based buffers or organic electrolytes.

With the development of new energy, green chemistry and biomedical technology, the research and application of lithium lactate crystals are showing a diversified trend. Its potential in lithium batteries has attracted attention, especially in the development of new organic electrolytes, solid electrolytes and environmentally friendly battery materials. At the same time, because it is derived from lactic acid, has renewability and low toxicity, lithium lactate is favored by green synthesis and sustainable material research, and is expected to be further expanded in the fields of biodegradable materials and medical sustained-release systems in the future.
