Abstracts

The global Lithium-Selective Ion Exchange Resin market size is predicted to grow from US\$ 171 million in 2025 to US\$ 741 million in 2032; it is expected to grow at a CAGR of 23.3% from 2026 to 2032.

Demand is mainly driven by the industrialization of direct lithium extraction, with core incremental demand coming from the development of unconventional lithium resources such as salt lake brines, geothermal brines, and oilfield produced water. Compared with traditional solar evaporation routes, the ion exchange resin route is more suitable for resource scenarios with low lithium grades, high Mg/Li ratios, restricted climatic conditions, or requirements for continuous production. It can shorten the lithium extraction cycle, reduce land use, and improve lithium recovery. Therefore, buyers focus not only on resin unit price, but also on adsorption capacity, lithium selectivity, cycle life, dissolution loss, desorption solution concentration, and long-term operating data in real brines.

On the supply side, the model is shifting from standalone resin sales toward a combined offering of 'materials + column process + pilot validation + engineering package.' Ion exchange resin or adsorption material companies such as Sunresin, Purolite, Muro-Chem, Suqing, and Zhengguang have strong material foundations, while some membrane, water treatment, and DLE technology companies also enter this segment through in-house development or partnerships. Because magnesium, calcium, boron, sulfate, organic matter, and suspended solids vary greatly across different brines, products are difficult to fully standardize. A 'one-lake-one-solution' approach remains the industry mainstream, and suppliers with project validation data and continuous system integration capability are more likely to obtain high-value orders.

In the short term, lithium price fluctuations will affect the pace of some new projects, but they will not change the long-term demand for efficient separation materials in salt lake and geothermal brine resource development. The current market is still in the early scale-up stage, with limited size but high growth. Major growth comes from capacity expansion of Chinese salt lake projects, process upgrades in South American salt lake projects, and the advancement of DLE demonstration projects for geothermal brines in Europe and North America. Future competition will shift from 'whether it can adsorb lithium' to 'whether it can operate stably, with low loss and low cost, over multiple cycles.' Resin lifetime, regenerant consumption, impurity tolerance, and full-process lithium recovery cost will become key factors determining product premium potential.
