Lithography lens is a component used in lithography machines to optically magnify and project patterns on a mask onto photoresist. It uses curvature differences to refract light and achieves different projection effects by adjusting parameters such as the distance, position, and tilt between the lens and the mask. The magnification and focusing accuracy of photolithography lenses directly affect the size and shape of the graphics, therefore their quality and accuracy are crucial.

The global Lithography Lens market size is projected to grow from US\$ 1102 million in 2024 to US\$ 1619 million in 2030; it is expected to grow at a CAGR of 6.6% from 2024 to 2030.
