## Abstracts

The global Livestock Breeding Probiotics market size is predicted to grow from US\$ 7601 million in 2025 to US\$ 13785 million in 2032; it is expected to grow at a CAGR of 8.9% from 2026 to 2032.

In 2025, global sales of Livestock Breeding Probiotics reached 1.85 million tons, with an average selling price of US\$4,200 per ton. Livestock Breeding Probiotics refer to biological products made by screening and cultivating beneficial microbial strains (such as lactic acid bacteria, Bacillus, and yeast), applied as additives to feed or drinking water to improve the intestinal microecological balance of animals, enhance immunity, promote growth performance, and replace some antibiotic functions. They are widely used in pig, poultry, ruminant, and aquaculture. Upstream raw materials mainly include parent strains, fermentation media (such as corn steep liquor and molasses), carrier materials, and freeze-drying protectants. Downstream, they mainly connect with large-scale farms, feed manufacturers, and animal health product distributors. In the future, with the advancement of 'antibiotic-free farming' and green livestock concepts, products will develop towards compound strains, high stability, and customization. The industry's total capacity is approximately 2.3 million tons per year, with a gross profit margin of approximately 35%. Downstream consumption is mainly for pigs and poultry, accounting for the largest share, followed by ruminants and aquaculture; fermentation media and energy costs account for a relatively high proportion of upstream material consumption. On the demand side, the global scaling up of the livestock industry and increasingly stringent environmental regulations are accelerating the process of probiotics replacing antibiotics. Coupled with the demand for improved feed efficiency, this will bring continuous growth potential to the industry, especially in Asia and Latin America, where there are significant business opportunities.
