The global Livestock IoT market size is predicted to grow from US\$ 2622 million in 2025 to US\$ 4595 million in 2032; it is expected to grow at a CAGR of 8.5% from 2026 to 2032.

The Internet of Things (IoT) in livestock farming refers to the application of sensors, smart terminals, wireless communication, and cloud platforms to the entire livestock breeding process, enabling real-time monitoring and intelligent management of animal health, growth, behavior, environment, and feeding. This system solves problems in traditional farming such as high labor costs, delayed disease warnings, and significant feed waste. Gross profit margins average between 40% and 65%.

The upstream of the livestock IoT industry chain mainly relies on sensor chips for temperature, acceleration, and heart rate, combined with communication modules such as LoRa and NB-IoT, and packaging materials such as lithium batteries, ABS, and TPU to construct smart terminal devices. The downstream serves livestock enterprises, farmers, veterinary service providers, and feed companies, enabling livestock health monitoring, behavior recognition, and breeding management. Future development trends include AI-driven disease prediction and behavior analysis, edge computing to improve real-time response capabilities, blockchain technology for traceability management, and multi-species integrated platforms to promote cross-scenario data fusion and intelligent decision-making.
