The global LNG Filling and Unloading Control System Overall Solution market size is predicted to grow from US\$ 9945 million in 2025 to US\$ 15890 million in 2032; it is expected to grow at a CAGR of 7.1% from 2026 to 2032.

LNG Filling and Unloading Control System Overall Solutions refer to comprehensive sets of technologies and procedures designed to manage and control the filling and unloading processes of Liquefied Natural Gas (LNG). It covers the control of filling and unloading operations from LNG transport vehicles (such as LNG tankers, LNG ships) to storage facilities (such as LNG storage tanks), and from storage facilities to terminal use equipment (such as gas dispensers at LNG filling stations). It has the following functional features:

- Automated operation function: It can realize the automation of LNG filling and unloading processes, reduce manual intervention, and improve the accuracy and efficiency of operations. For example, at an LNG filling station, after the vehicle enters the station, the control system can automatically identify the vehicle type and gas filling requirements, and automatically complete the gas filling operation according to the preset gas filling procedure without manual adjustment of each valve and equipment.
- Safety guarantee function: Through multiple safety measures of hardware and software, such as emergency shut-off system, safety interlock, alarm system, etc., the safety of LNG filling and unloading process is guaranteed. Once an abnormal situation occurs, such as leakage, fire, equipment failure, etc., the system can respond quickly and take corresponding safety measures, such as closing valves, stopping equipment, and sounding alarms, to minimize the harm of accidents.

- Data management and analysis function: collect, store and analyze various data during the filling and unloading process. These data can be used for equipment maintenance, performance evaluation, process optimization and other aspects. For example, by analyzing the pressure and temperature data during the LNG filling process, the working status of the filling equipment can be evaluated, possible equipment failures can be predicted, and maintenance can be performed in advance, thereby improving the reliability and service life of the equipment.
- Remote monitoring and operation function: With the help of network communication technology, operators can monitor and operate the LNG filling and unloading process in the remote control center. This is very important for large LNG receiving stations or gas stations distributed in different areas. It facilitates centralized management and scheduling and improves management efficiency. For example, at an LNG receiving station, managers can view the unloading of LNG from ships in real time through the remote monitoring system in the central control room, and remotely adjust the operating parameters of the equipment as needed.
