A Load-lock is a vacuum chamber used in the vacuum and semiconductor industry for loading devices like semiconductor wafers from ambient air pressure conditions into the main vacuum processing chamber. In the semiconductor industry, the process vacuum chamber is maintained at high vacuum pressure and not vented to ambient pressure during process cycles. An auxiliary vacuum chamber is required to isolate the wafers from the main process chamber when ventilated.

A typical semiconductor manufacturing equipment is composed of two load lock chambers, one mainframe chamber, also called transfer chamber, and several process chambers. Wafers enter and exit the tool through the load lock chambers, which are used to change the wafer pressure conditions from atmospheric to low pressure & vice-versa. The transfer chamber allows the automated handling of the wafers between load lock and process chamber or between process chambers.
