Locally systemic fungicides are a type of agricultural fungicide with limited systemic conduction ability. After being applied to the surface of plants, they can penetrate and diffuse in local tissues, but they will not move widely throughout the plant like systemic fungicides. This type of fungicide can form a protective layer under the leaves, stems or epidermis of the sprayed area, effectively inhibiting the growth and spread of pathogens in the contact area, and is suitable for preventing and controlling early or localized fungal diseases. Typical varieties such as Azoxystrobin and Tebuconazole are widely used in crop protection. They have the advantages of moderate residual effect period, strong resistance to rain erosion, and high safety to plants. They are often used in disease prevention and management of fruits, vegetables, grains and cash crops.
