Locking screw equipment is a device used to prevent loose screw connections, which uses different methods to increase the friction or locking force between the screw and the nut, thereby maintaining the preload and connection stability. There are many types of locking screw equipment, which can be divided into the following categories according to their working principle and design characteristics:

Press-in locking: This type of device uses elastic elements to compensate for slack and creep, thereby maintaining a portion of the preload and keeping the connection from loosening.

Locking locking: This type of device increases the friction on the screw lever chemically or mechanically, thereby increasing the tightening torque and preventing the connection from loosening completely. At the same time, the loss of preload can be minimized.

Anti-rotation locking: This type of equipment is capable of maintaining at least 80% of the preapplied preload under high dynamic loads by mechanically locking or bonding together mating threads. This is essential to ensure the proper functioning of components in safety-related applications.
