The global Logarithmic Mutual Resistance Amplifier market size is predicted to grow from US$ million in 2025 to US$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Logarithmic mutual resistance amplifier is an electronic circuit that converts signals with wide dynamic range into signals with narrow dynamic range, while maintaining the logarithmic relationship between input and output signals. It is usually used in signal processing applications that need to process a wide range of signal amplitude. The amplifier works by using a pair of transistors in a differential configuration. One transistor is biased by a fixed current, while the other transistor is biased by a variable current depending on the input signal. The difference in current leads to a logarithmic relationship between the input and output signals.
