Logging while drilling equipment is a high-tech instrument used to obtain real-time formation and downhole environmental data during the drilling process. It is usually integrated into the drill string and includes a sensor module, a data transmission system, and a power supply unit. It can measure parameters such as resistivity, density, acoustic wave velocity, porosity, etc. of the formation, while monitoring downhole pressure and temperature. These devices are designed with high temperature and high pressure to adapt to the complex downhole environment, and transmit real-time data to the ground for oil and gas reservoir evaluation, wellbore trajectory optimization, and drilling safety management.
