Abstracts

The global Long-Acting HIV-1 Inhibitors market size is predicted to grow from US$ 373 million in 2025 to US$ 510 million in 2032; it is expected to grow at a CAGR of 4.7% from 2026 to 2032.

Long-Acting HIV-1 Inhibitors represent a class of antiretroviral formulations that utilize innovative pharmaceutical technologies (e.g., nanocrystals, liposomal encapsulation, or prodrug design) to extend drug duration in the body, with the primary goal of transitioning from daily oral dosing to dosing intervals of weeks or months. These medications maintain stable drug concentrations to sustainably suppress viral replication, significantly improving patient adherence and reducing side effects, particularly suitable for long-term HIV management and pre-exposure prophylaxis (PrEP). Current formulations include intramuscular injections, subcutaneous implants, and extended-release oral dosage forms, with technological barriers primarily lying in complex drug delivery system design and controlled release kinetics.

From a supply chain perspective, the upstream sector involves the supply of high-purity active pharmaceutical ingredients (APIs), specialty excipients (e.g., biodegradable polymers, stabilizers), and advanced packaging materials (e.g., pre-filled syringes). The midstream encompasses complex formulation development (including pharmacokinetic studies and stability testing), sterile manufacturing under GMP standards, and rigorous quality control systems. Downstream distribution occurs through specialized pharmaceutical logistics channels, disease control centers, and designated pharmacies to reach end patients, requiring?? professional healthcare training and usage guidance. Key supply chain challenges include ensuring stable supply of specialty excipients, meeting cold chain logistics requirements, and navigating complex multinational regulatory compliance, necessitating interdisciplinary technology integration and global
