Interferons are proteins that are part of your natural defenses. They tell your immune system that germs or cancer cells are in your body. Interferon injection is a broad-spectrum antiviral agent that does not directly kill or inhibit viruses, but uses cell surface receptors to cause cells to produce antiviral proteins, thereby inhibiting virus replication. Interferons are currently used clinically to treat viral infections such as hepatitis C, cancers including non-Hodgkin's lymphoma, and autoimmune diseases such as multiple sclerosis.

Long-acting interferon injection is an interferon drug given once a week by intramuscular injection.

The global Long-acting Interferon Injection market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
