The global Long-acting Recombinant Human Erythropoietin Injections market size is predicted to grow from US\$ 944 million in 2025 to US\$ 1373 million in 2032; it is expected to grow at a CAGR of 5.6% from 2026 to 2032.

Long-acting erythropoietin (EPO) drugs are a type of medication used to stimulate the production of red blood cells in the body. These drugs are primarily prescribed for individuals with certain medical conditions, such as anemia associated with chronic kidney disease or cancer treatment.

The market for long-acting recombinant human erythropoietin injections is a vital biopharmaceutical product used primarily in the treatment of anemia, particularly associated with kidney disease and anemia resulting from chemotherapy in leukemia. The market is substantial and continues to grow, benefitting from the ongoing expansion of global healthcare systems and the persistent demand for anemia treatments. In the future, with the continued advancement of biotechnology and increasing therapeutic needs, long-acting recombinant human erythropoietin injections are poised for further development, potentially involving broader application areas and improved therapeutic solutions to offer more effective anemia management for patients.
