## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

Long-haul dark fiber refers to unused or unlit optical fiber cables laid over long distances, typically spanning hundreds or thousands of miles. Unlike lit fiber, which is actively transmitting data signals, dark fiber is "dark" because it is not currently in use. This infrastructure is often installed by telecommunication companies, internet service providers, or network providers to meet future bandwidth demands or to provide redundancy in their network infrastructure.

Dark fiber can be leased or purchased by other companies or organizations for their own network needs. By leasing dark fiber, companies can have more control over their network capacity, performance, and security. It allows them to deploy their own networking equipment and protocols, giving them the flexibility to scale their network according to their specific requirements.

The global Long-Haul Dark Fiber market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
